ACCURATE · RELIABLE · FLEXIBLE ·

Since its development in the 1950's the UV-Visible Spectrophotometer has evolved into an accurate and reliable analytical tool and it has become one of the most utilised instruments in today's scientific laboratory.

UV-Visible spectroscopy is a mature and well established analytical technique used extensively in many industry sectors including Environmental Analysis, Pharmaceutical Testing, Food and Beverage Production to name but a few. PG Instruments manufacture an extensive range of UV and Visible Spectroscopy instrumentation guaranteed to meet the needs of your application. Further information on the UV-Vis product line along with a brief introduction to UV-Vis Spectroscopy can be found in this brochure.

UV-Vis Spectroscopy

UV-Vis Spectroscopy is an analytical method used to measure the absorbance of ultra-violet or visible radiation through an analyte. The molecular

absorption of the analyte corresponds to both excitation of valence electrons and excitation of electrons in different atomic orbitals.

UV-Vis Spectroscopy is an effective technique for both qualitative and quantitative analysis of organic and inorganic compounds.

UV-Vis Spectroscopy is based on the Lambert-Beer principle which states that the Absorbance of a solution (A) is directly proportional to its pathlength (l) and its concentration (c) when the wavelength of the incidence light remains fixed.

This is summarized in the following equation, where ϵ is the molar absorptivity

$$A = \epsilon lc$$

ACCESSIBLE · ANALYSIS

UV-Vis Spectrophotometer

The UV-Vis Spectrophotometer is the analytical instrument used for the UV-Vis spectroscopic analysis. Spectrophotometers are available in different configurations however most can be categorized into either single beam, split beam or double beam types depending on the design of their optical system. Such types of instrument comprise the following components in their constructions:

- Light Source
- Monochromator
- Cell Compartment
- Detector
- Signal Processing System

Split Beam Spectroscopy

The Split beam approach to UV-Vis Spectroscopy uses a single beam of light separated into Sample and

Reference beams by means of a beam splitter using a separate detector for each. Split beam instruments have a reference detector housed inside the instrument optics offering the advantage of optical stability as in double beam spectroscopy whilst using the single beam measurement technique.

Double Beam Spectroscopy

The double beam approach to UV-Vis spectroscopy requires two beams of light, both having the same intensity to measure the Absorbance through sample and reference positions simultaneously. The Sample position is used for measurement of the analyte, whereas the reference position is used for the correction against a blank solution or sample matrix.

A clear advantage of the double beam optical system is the improvement in measurement stability and drift precision as a result of having a real-time feedback of both the reference and sample signals.

OPTICAL SYSTEM & COMPONENTS

High quality optical components ensure reliable analytical data with low stray light achieved using very low noise electronic circuits.

Deuterium and tungsten light sources deliver superior stability across the full wavelength range. Both types of lamp have self timers and are inexpensive and easy to replace when required.

The monochromator is completely sealed and the optical surfaces can be easily cleaned to maintain optimum reflectivity over the lifetime of the instrument.

A maintenance free high resolution direct stepper drive positions the grating precisely, which ensures reproducible wavelength scanning at different scan speeds, thus negating any wavelength peak shift.

The spectrophotometer shell is made from an environmentally friendly non corrosive material and a simple retaining mechanism on the base allows easy access for air filter changes and routine maintenance.

Windows CE Based Operating System with 320 x 240 touch screen TFT Interface.

The Spectrum workspace allows high speed spectral scanning, with zoom and peak identification tools. Spectral Scans can be performed in the field, stored to instrument memory and later transferred to the C30 Data Viewer Software for further inspection and reporting.

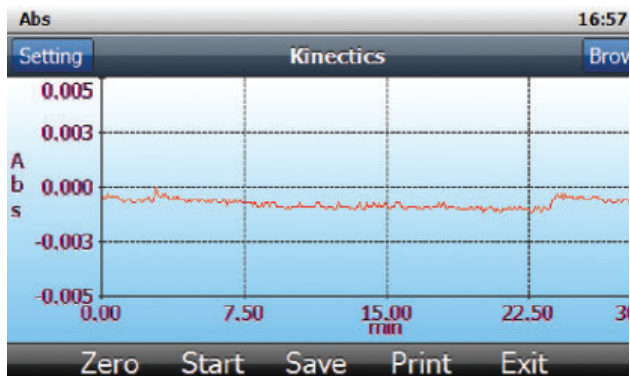

Use the Quantitative workspace to construct calibration curves, and measure concentration of unknown samples. Curves can be constructed in 1st – 4th order, whilst both methods and measurement data can be saved to instrument memory.

Sel.	ID	Mode	500.0mm	K*
1	Abs	22.000	44.000	
2	Abs	51.000	102.000	
3	Abs	36.000	72.000	
4	Abs	10.000	20.000	
5	Abs	72.000	144.000	

Use the Photometric workspace to quickly and easily perform fixed wavelength measurements in either Absorbance or Transmission. Set a K factor where multiplications are required to determine sample concentration. Once the measurement is complete store to instrument memory for future recall.

Sel	Name	Conc.	Abs	Measure Time	Sample Info
sample 1	2.93mg/L	0.117	03/02/2012 10:11		
sample 2	2.31mg/L	0.409	10/02/2012 10:58		
sample 3	2.39mg/L	0.372	10/02/2012 10:58		

The Kinetic workspace enables the measurement of Absorbance or Transmission as a function of time. Use the zoom and peak pick features to obtain a better view of the Kinetic curve. Measurement data can be saved and recalled at any time.

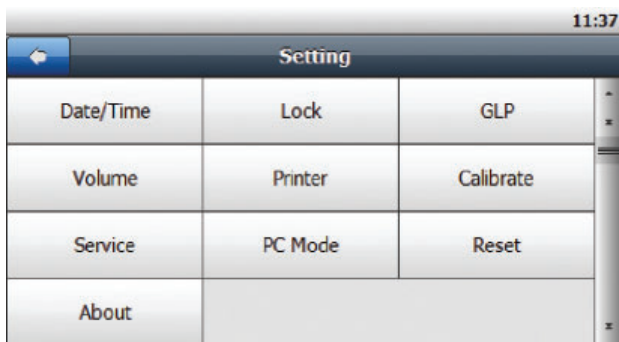

C30/C30M

User and admin rights are easily controlled from the GLP feature in the settings menu. Create user groups and specify their privilege level then add new users to a specified group.

Use the universal cell holder to measure various pathlength rectangular cells and rounds test tubes accommodating all of your sampling requirements.

Control instrument configuration from the settings menu.

Use the fibre dip probe for in-situ sample measurements.

Once all of the required field analysis has been performed and measurement data stored to instrument memory the Spectrometer can be connected to the C30 Data Viewer Software via USB for transfer of analysis data from all of the instrument workspaces. Use the Data Viewer Software to further interpret analysis results, export data into a wide variety of formats and produce analysis reports for storage or printing.
